PROTECT FORTE - mineral fertilizer is an ecological natural-mineral product for plant nutrition and soil quality improvement. The product is a powder, white color, odorless. It is compatible with all products for plant and soil treatments.

PROTECT FORTE can be used in several ways:

- Spreading and Plowing over the soil is recommended in the amount of 20-30 kg per Hectare (In extremely poor soil quality, this amount can be increased). The main function is to bring the Ph value of the soil to an adequately usable level by reducing acidity with the help of CaO and Zeolite, which has the role to reduce the attack of pathogenic elements in the soil. This is the improvement and rehabilitation of the soil.
- By spreading and Plowing in the area of the tree and roots of the plant among the fruits, vegetables and flowers, in autumn and early spring. The recommended quantities for application in this way are as follows: 1. Raspberry, Strawberry, Blueberry, Vine, ... from 100-150 gr per tree. 2. Apple, Plum, Cherry, Quince, Olive, Citrus, Lemon, Orange, ... from 200-250 gr per tree. 3. Tomatoes, Cucumbers, Peppers, Potatoes, Beans and all kinds of Flowers, ... from 50-100 gr per tree. Also, these amounts can be applied when planting the above-mentioned plant crops, production of seedlings and planting flowers, because it improves the reception, germination and growth of the plant.
- Foliar application by mixing with water at a rate of 1 kg/100 liters of water and spraying over the green parts of the plant. For all types of cereal crops at foliar treatment - 30 kg. per 1 hectare. It is compatible with all products and has no withholding period. Treatment can be done every 10-15 days as a supplement to plants. It can also be used in the same proportion for plant nutrition and soil quality improvement in the drip system.

Our recommendation is that after mixing with water, the resulting solution must be filtered before pouring into the tank due to the possible appearance of sediment.

PROTECT FORTE - Basic nutrients: Calcium (CaO) - 35%; Magnesium (MgO) – 5%; Phosphorus (P), Zinc (Zn), Potassium (K) - in smaller amounts, with the addition of highly active clay Zeolite up to 10%.

Calcium ensures the reduction of soil acidity and proper nutrition of the plant. Magnesium accelerates the process of photosynthesis and the necessary nutrition of the plant. Zeolite reduces the attacks of pathogenic elements and the content of heavy and dangerous substances.
